# ETI High Performance Data Integration

## Value Faster Through Transparency

ETI products provide high performance data integration capabilities for data synchronization, migration and composite data services for SOA initiatives. As a complement to ETL, EAI, SOA and data warehousing technologies, ETI's data integration platform extends the value of IT investments by providing high performance connectivity and transformations as organizations combine legacy and proprietary data sources with current technologies.

Using ETI products, you gain a transparent enterprise where all of your data architectures, both legacy and state-of-the-art, work hand-in-hand to provide visibility into every aspect of the organization. By complementing and extending your existing technologies, we remove the technology barriers, allowing you to see deeper into your business. The results are clearer thinking, more inspired decision-making, regulatory compliance and faster time to value.

Our suite of award-winning software products can solve your immediate point-to-point integration needs as well as provide an enterprise-level platform on which you can manage the most complex of integration efforts.

### ETI Solution® Data Integration Platform

ETI's flagship software is the most scalable enterprise integration platform available. This product is unsurpassed at any type of data integration from Java/XML (SOA integrations) to legacy COBOL, proprietary or multibyte data. There is no other product on the market with greater flexibility that combines the ability to quickly generate highly reliable, scalable, fully documented integration processes without the administrative overhead or financial cost of licensing proprietary run-time software.

### ETI Built-to-Order™ Integration (BTO)

No training. No configuration skills required. No platform software to install. No on-going maintenance burden. BTO integration software can be deployed in as little as two weeks. Leveraging the power of ETI Solution, ETI provides built-to-order connectors that integrate mainframe, legacy and proprietary applications with your current business intelligence, data warehousing and SOA-based infrastructures.

### ETI Data Quality

The key to any successful integration project is knowing the form and structure of your data prior to moving it or transforming it. ETI Data Profiler™, ETI Data Cleanser™ and ETI Data Monitor™ provide sophisticated analysis to discover the content, structure and quality of data sources before you start your IT project. These capabilities reduce total project time by over 30% by eliminating manual analysis of data.

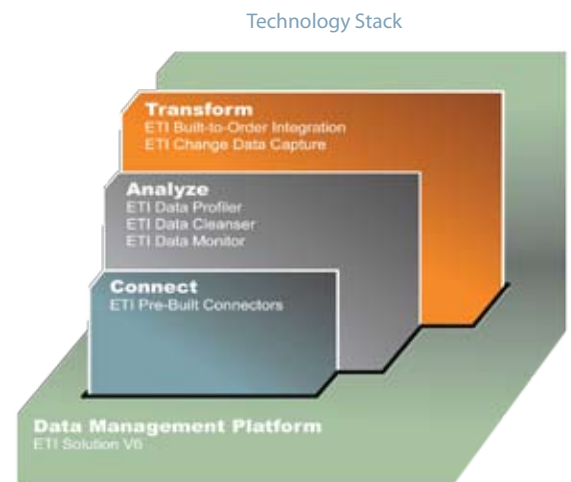

### ETI Change Data Capture™

ETI Change Data Capture (CDC) meets modern demands by integrating data from a wide variety of legacy and transaction systems and managing the process so that the data is easily accessible when and where the organization needs it. This capability allows you to keep your source and target systems much more closely in sync than using full data extracts. ETI CDC provides a broad range of support for mainframe, midrange, packaged application, proprietary system and relational data sources.

### ETI Pre-Built Connectors

ETI's line of High Performance Connectors™ (HPCs) for SQL Server 2005 provides you the ability to load Teradata, Oracle, DB2 and other complex data sources up to 20 times faster than standard connectors.

For over fifteen years, ETI has been recognized as an innovator in the data integration field. Our products have been delivering up to 40 times increase in productivity for many of the world's largest corporations and government agencies. We are building on this heritage to help companies around the globe extend and complement existing technologies to maximize the efficiency and effectiveness of their data integration efforts.

2006 Microsoft Partner Awards Program Winner in the Customer Experience Award Category

2006 Bloor ETL Bullseye™ Report Champion Silver Award Winner in the Enterprise and Organizational Categories
